Cotton Varieties Planted, United States
1981 Crop

Deltapine and Stoneville were the leading varieties of upland cotton planted in the United States during the 1981-82 season, according to the Cotton Division, Agricultural Marketing Service, USDA. Each of these varieties accounted for 16 percent of the national acreage. Acala was the next most popular variety at 13 percent of the acreage, followed by Lankart at 10 percent, Paymaster and Tamcot at nine percent each, and GSA at seven percent of the U. S. acreage.

Deltapine and Stoneville were the two leading varieties of upland cotton planted in the United States again this season. Each accounted for 16 percent of the acreage planted, up from 15 percent each, a year earlier. Deltapine was the leading variety planted in Louisiana and Arizona and was the second most popular variety in Alabama, Mississippi, Tennessee, Missouri, Arkansas and California. The leading Deltapine strain was Deltapine 61 which accounted for six percent of the U. S. acreage. Stoneville was the most popular variety in Alabama, Mississippi, Tennessee, Missouri and Arkansas and was the second leading variety in Louisiana and Arizona. Stoneville 825 was the most popular Stoneville strain, making up 11 percent of the U. S. acreage.

Acala was the third leading variety planted in the United States, accounting for 13 percent of the acreage and up from 10 percent a year earlier. Acala was the leading variety in New Mexico and California. Acala SJ-2 was the leading strain planted in California and accounted for 10 percent of the U. S. acreage. The leading Acala strain in New Mexico was Acala 1517-75.

Lankart, at 10 percent of the United States upland acreage, was the next most popular variety. Lankart also accounted for 10 percent of the 1980 crop. Lankart was the most popular variety in Oklahoma. Lankart 57 and Lankart 611 were the most popular strains, each accounting for four percent of the U. S. acreage.

Paymaster and Tamcot were the next leading varieties planted, each accounted for nine percent of the United States acreage. The previous year these two varieties accounted for seven percent each. Paymaster and Tamcot tied as the leading variety planted in Texas. The most popular Paymaster strain was Paymaster 303 at five percent of the U. S. acreage. The most popular Tamcot strain was Tamcot SP-21 at four percent of the U. S. acreage.

GSA, planted in Oklahoma, Texas and New Mexico, accounted for seven percent of the U. S. acreage. The leading GSA strain was GSA 71 at six percent of the acreage.

Pima S-5 remained the most popular strain of American Pima cotton planted in the United States. Pima S-5 made up about 99 percent of the U. S. acreage, down from virtually 100 percent the previous year. Pima P-34-SP accounted for one percent of the U. S. acreage in 1981 and was planted primarily in Arizona.

Estimates of the percentage of the various varieties of cotton planted in the United States in 1981 by counties, marketing services office areas and states are presented in this report. Comparative data for the previous year are shown by states. The variety data are based primarily on estimates furnished by cotton ginners for the territories served by their gins.

Estimated percentage of cotton acreage planted to specified varieties, United States,
1977-1981

^{1/} Compiled from "Summary of Cotton Fiber and Spinning Test Results, Crop of 1980", USDA, AMS, Cotton Division, July 1981.

^{2/} Micronaire reading is a measure of fiber fineness and maturity. This test measures resistance of a plug of cotton to air flow.

^{3/} Fiber strength indicates ability of cotton fibers to withstand force or tension, and has a strong bearing on spinning utility. Zero gage fiber strength test made without a spacer between clamp jaws using Pressley flat bundle tester. 1/8" gage strength test made with 1/8" spacer between clamp jaws using stelometer and results are adjusted to the Pressley level.

^{4/} Digital Fibrograph 2.5% span length indicates length spanned by 2.5 percent of the fibers when they are parallel and randomly distributed. This measure is closely related to staple length designations. Digital Fibrograph 50/2.5 uniformity ratio values indicate relative uniformity of fiber length in samples.
